Streamlined Ordering Process System

Team Roles and Responsibilities

John Rex B. Delos Santos

Project Manager & Programer

Leads the project team and develops the Python program. Responsible for coordinating tasks, writing the code, and ensuring that the system meets the coffee shop owner's needs.

Christine A. Bengaura

Business Analyst

Responsible for identifying the coffee shop owner's problems, gathering information, and determining the system requirements needed to address those problems.

Shaira V. Dellomos

Designer

Responsible for designing the system's layout, creating its user interface, and planning how users navigate and interact with the program.

Ronabell C. Arduo

Quality Analyst

Responsible for testing the system, verifying calculations and order records, finding errors, and making sure the program functions properly.

Problem Statement

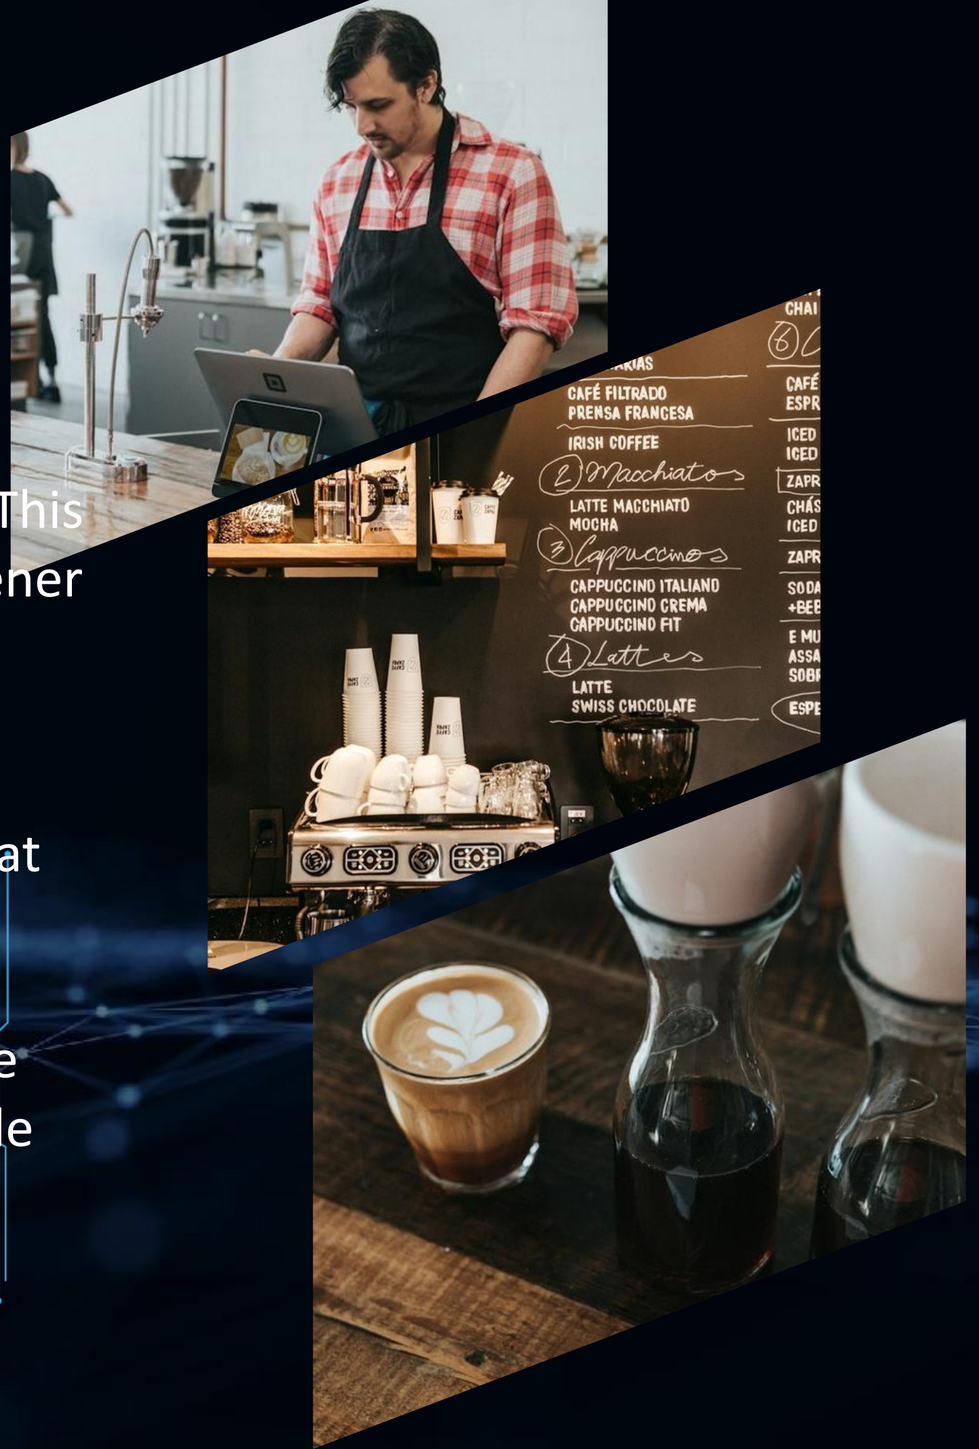

Coffee shops often encounter problems with their ordering systems especially at busy times of the day. This can cause queues for customers, wrong orders and slow down ordering processes. The issues can be caused by manually recording orders, communication issues between staff and customers and no order tracking systems. These can then cause waiting times to increase, waste of ingredients, confusion and customer unhappiness. The BrewTrack: Coffee Shop Ordering System project will aim to help with these issues by creating a streamlined ordering system. It will help track the customers orders, record what drinks they want and any modifications they would like. It will also give each order a unique number and calculate the total cost for the order. Providing an order tracking system will help to ensure orders are accurate, reduce waiting times and increase the efficiency of the coffee shop.

Objectives

- Allow ordering of different sized drinks and sweet levels plus other special requests.
- Minimize errors by giving a unique order number and showing a summary of their order.
- Improve their ordering experience by working out the total cost and giving them an update on their order. Including when their drinks are ready to be picked up.

Project phase: BrewTrack
System Features:

Features:

1. Take customer orders (recorded as orders in the system). This will include information such as size of drink, level of sweetener and any other customisations.
2. Generate an order number. This will be a unique number that helps identify the order.
3. Shows what drinks have been ordered. The staff can look at this to confirm orders.
4. Calculate total cost of order.
5. Update order status. The staff can update the status of the order so that the customer knows if their order is being made or it ready to collect.

Scope and Delimitation

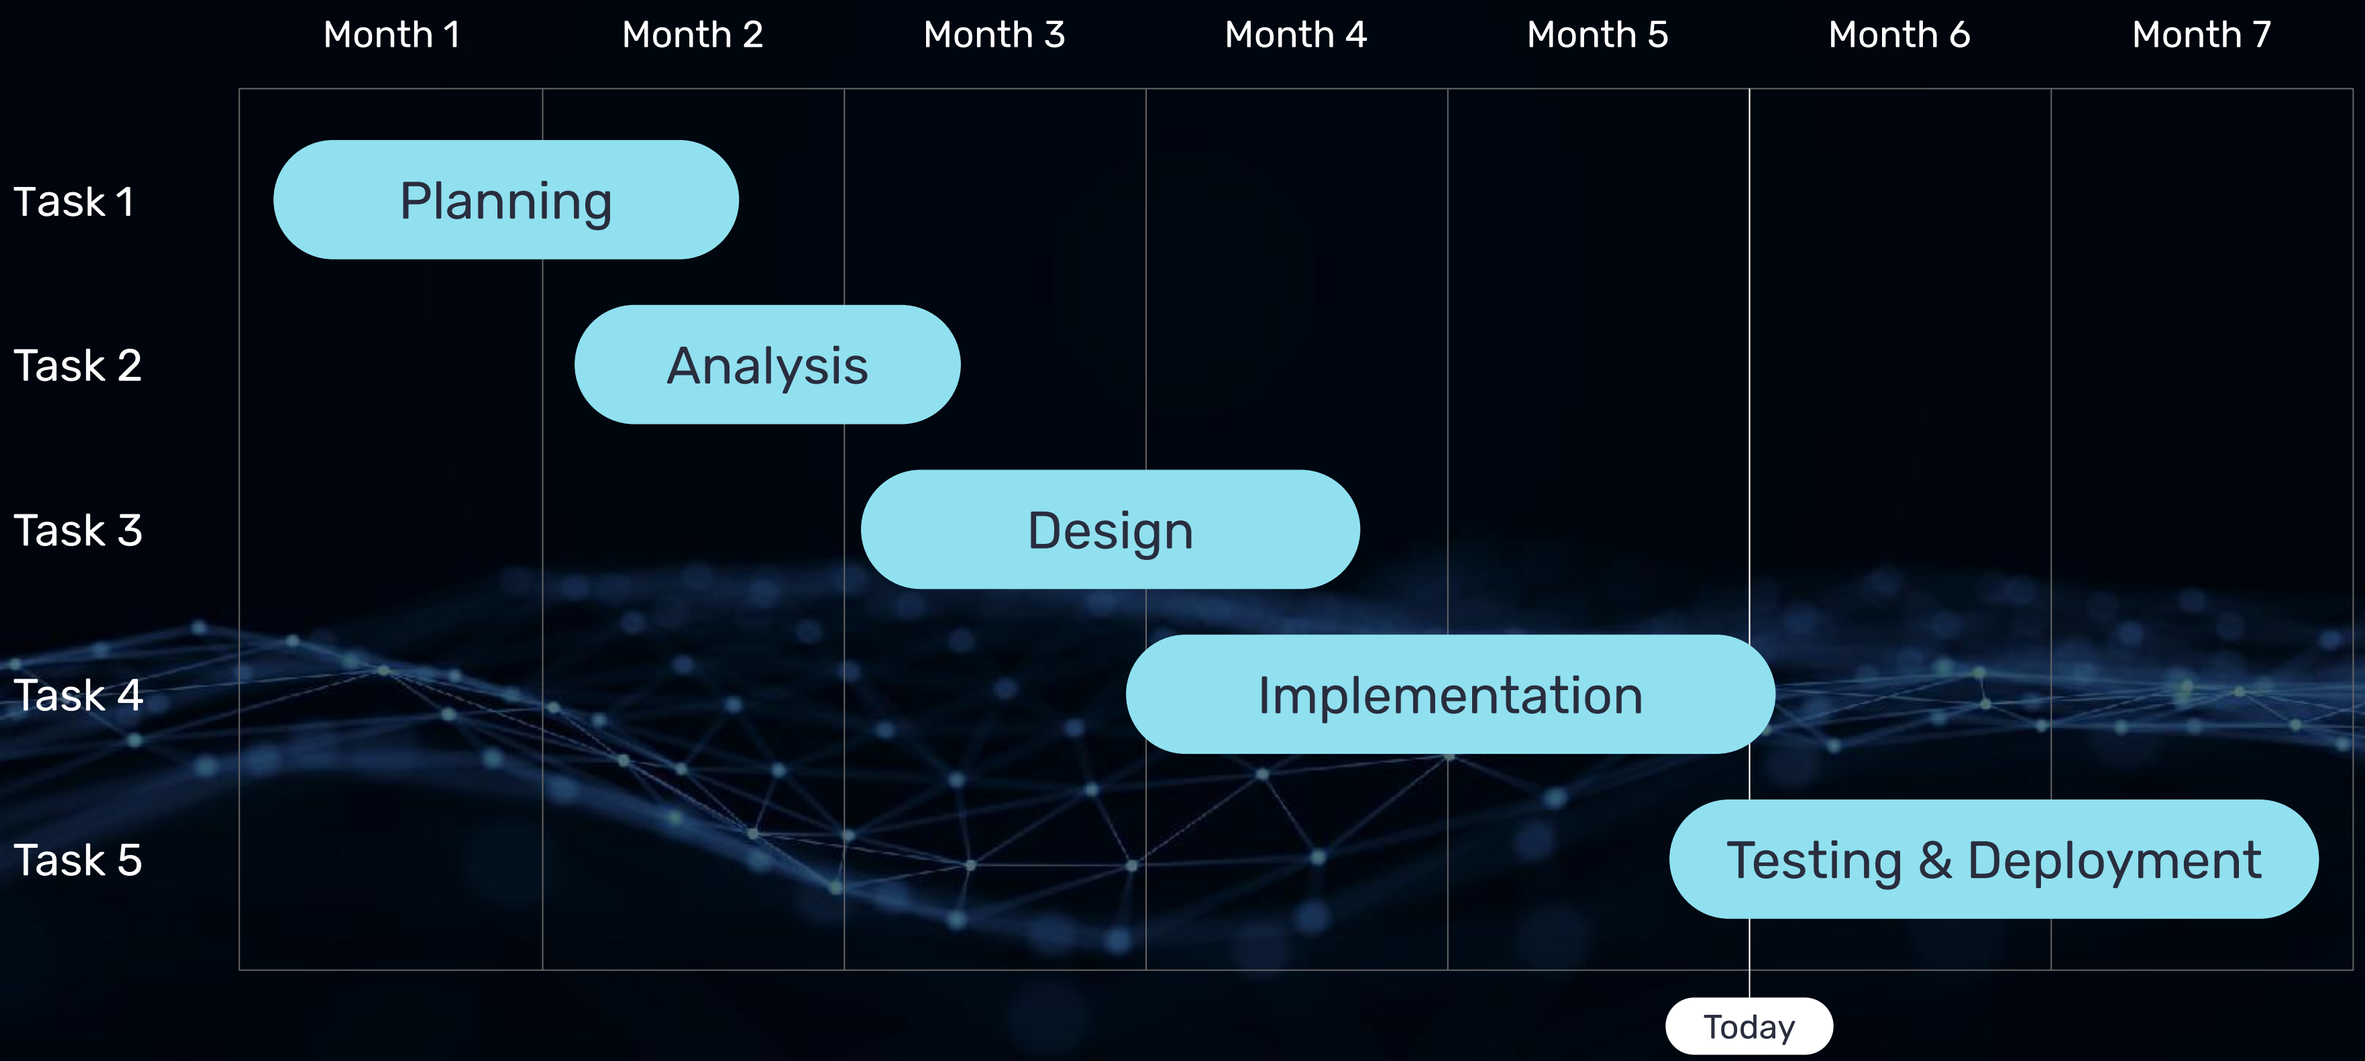

Scope

This application will help manage customer orders. This means staff can enter in what size, sweetness etc they want. An order number will be created, a summary of their order will be displayed and the cost calculated. Finally staff can update the status of their order so customers know when their drinks are being made or ready to collect.

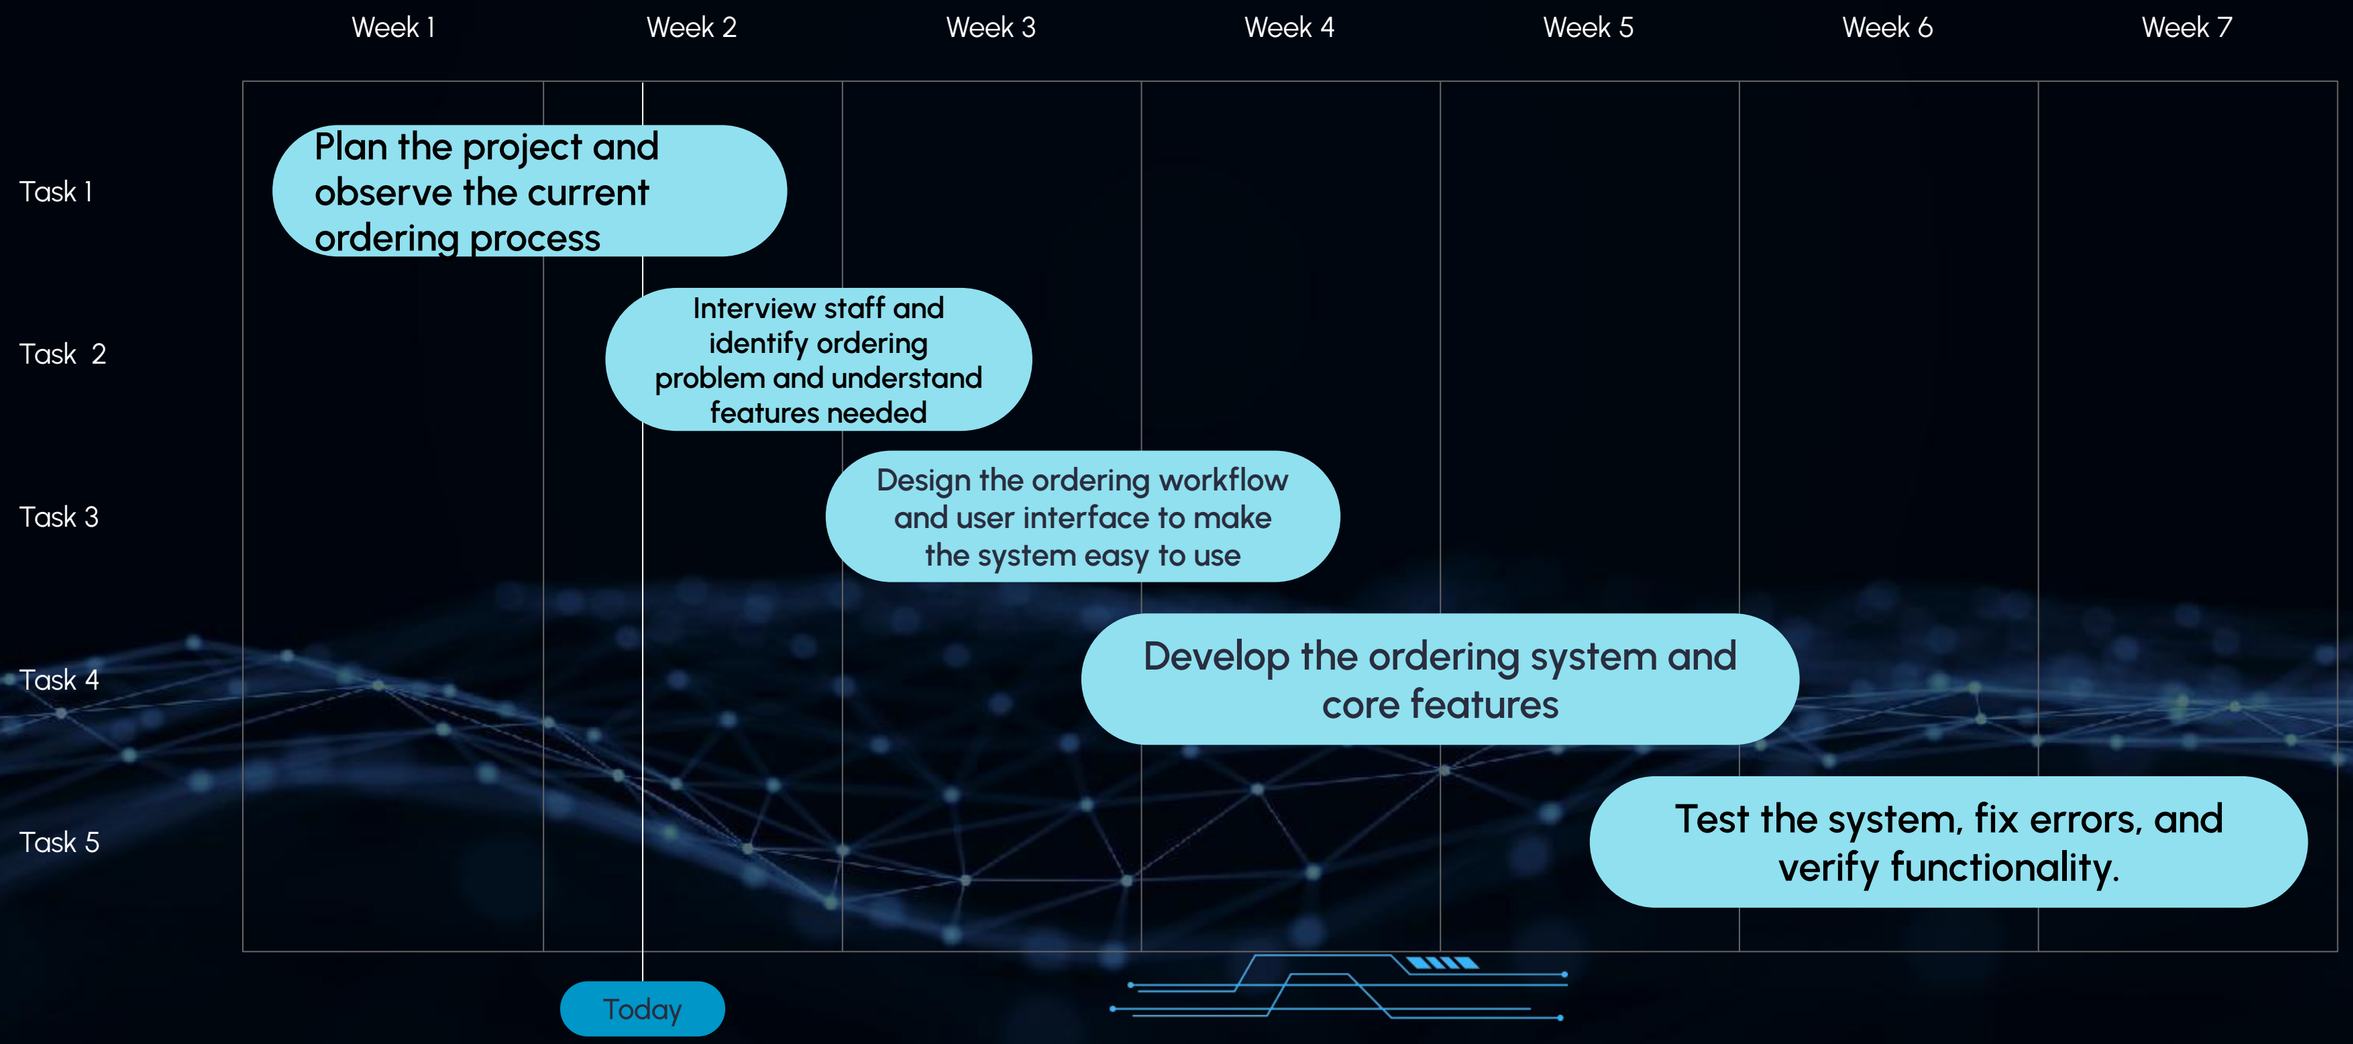

Delimitations

The system will not be able to manage ingredients in stock, auto-restock, detailed sales reports, payments online, or delivery. The system will rely on staff to input the correct information for the orders and update the statuses correctly.
